$$\mu \geq 0_S$$

$$x \geq 0_S$$

Feasible solution $x \in \mathcal{D}_x$

$$Ax = b \quad \text{Rz}(A) = L \quad S \geq L$$

Basic solution

$$x^B = B^{-1}b \quad B - \text{matrix containing } L \text{ kolumn of the matrix } A$$

the total number of basic solutions is at most:

$$\frac{S!}{L!(S-L)!}$$

Basic feasible solution $x^B \geq 0_L$

Not degenerated basic feasible solution $x^B > 0_L$

The simplex method

1. Changing the basis
2. Convergence criteria – the stopping condition
3. Generation of initial feasible solution
4. Dealing with degenerate basic solutions

$$Ax = b \quad x_B = B^{-1}b \text{-- the basic solution}$$

$$x_B = B^{-1}Ax$$

$$Ax - b = 0_L \quad /B^{-1}$$

$$B^{-1}Ax - B^{-1}b = 0_L$$

$$cx = cx - c_B(B^{-1}Ax - B^{-1}b) = (c - c_B B^{-1}A)x - c_B B^{-1}b$$

The simplex method

1. Generation of initial basis
2. Checking $c - c_B B^{-1} A \geq 0_S$. If it holds, then x_B is basic feasible solution $x = [x_B \ 0]$
3. Such a k that $c_k - z_k = \min_{1 \leq s \leq S} (c_s - z_s)$ is introduced to the basis
4. Checking, whether $h_k \leq 0$, if it holds true – solution is unbounded
5. Removing such l from the basis, for which:

$$\frac{h_{l0}}{h_{lk}} = \min_{1 \leq s \leq S} \left\{ \frac{h_{s0}}{h_{sk}}, h_{sk} > 0 \right\}$$

$$6. \quad I_B := I_B \setminus \{l\} \cup \{k\}$$

$$I_B = \{j \in \{1, 2, \dots, S\} \mid x^{(j)} \text{ belongs to the basis} \}$$

Example

$$F(x) = -2x^{(1)} - 3x^{(2)} + 0x^{(3)} + 0x^{(4)} + 0x^{(5)}$$

$$2x^{(1)} + 2x^{(2)} - 14 \leq 0 \rightarrow 2x^{(1)} + 2x^{(2)} + x^{(3)} = 14$$

$$x^{(1)} + 2x^{(2)} - 8 \leq 0 \quad x^{(1)} + 2x^{(2)} + x^{(4)} = 8$$

$$4x^{(1)} - 16 \leq 0 \quad 4x^{(1)} + x^{(5)} = 16$$
